

PAUL'S GATES

Security Solutions

"There is no substitute for Quality"

Securing homes & businesses with integrated, multi-layered systems for nearly 40 years

Paul's Gates offers integrated, turnkey security and surveillance systems that dovetail high-tech access control equipment, including biometric solutions, intercoms and surveillance cameras, with mechanical barriers, such as gate automation, electric fencing and alarms, to provide multiple layers of security for residential and business sites.

Left and above: Automated sliding gates integrated with a CCTV surveillance system and Mircell GSM intercom, electric fencing and turnstile at Brookwood residential estate. Below: Parkmore (Johannesburg) road closure project: 27 streets closed with ClearVu fencing and booms.

Above: Access control with cameras, booms, GSM intercom system and ClearVu fencing at Fernbrook Estate, Craigavon (Fourways).

Below: A commercial application: a custom-made Mentis grating-style, automated sliding gate.

Paul's Gates is a family-founded and -led business that has retained the hallmark of excellence since 1978

"Paul's Gates goes way beyond installing standalone barriers against crime," says managing member Graham Salvado. "We design, implement and service long-term and interactive solutions that provide customers with access control management platforms that can be expanded with ease over time.

"We have, for example, a CCTV-alarm integrated system that enables customers to log access to, view, monitor, open and close their properties from anywhere in the world via live streaming on their Smart devices."

Since 1978: A foundation of family values

When it was founded in 1978 by Graham's parents, Paul and Patsy, Paul's Gates soon became known for its excellent workmanship in custom-designed wrought iron gates, burglar bars, balustrades and gate automation. Its steelwork range remains a hallmark of the business

today. As far as Paul's Gates is concerned, "There is no substitute for quality."

Paul and Patsy are still involved in the business. Graham joined Paul's Gates in 1993. His wife, Megan, is the financial director. It is their family values and personal commitment that drive the management of the company. Their business philosophy has translated into empowered and committed staff members who deliver reliable customer service, which has, in turn, maintained a three-generational customer base.

Products & services available across Africa

The company's head office and manufacturing facility are in Kya Sands Industrial Park, Johannesburg. Its teams install and service its products and systems throughout South Africa and across Africa. A 24-hour emergency service is available in South Africa.

In addition to innovating its own range to meet customers' individual requirements, Paul's Gates has partnered with high-end brands such as Centurion Systems' gate automation and access control, Comb Communications' Mircell GSM intercoms, Cochrain ClearVu fencing, Stafix electric fencing, Spectrum's Paradox alarms and Jablotron alarms.

Biometric access control & time and attendance integration

Fingerprinting of every individual who is authorised to enter a property is the basis of a computerised biometric access control system. A host of other personal identification data is recorded in the database, including copies of identity documents and photographs. No-one gets in without his or her fingerprints and identifying information having been verified by the system first. This solution has the option to be integrated with time and attendance logging and tailored time-barring.

Biometric systems log all transactions and are able to restrict access to the property as a whole and/or to certain zones within the property.

Access control devices available from Paul's Gates include biometric and proximity readers, remote controls, keypads, turnstiles and booms.

Intercom systems

Commercial applications: Mircell GSM intercoms provide secure access via an internet-operated platform that facilitates the management of contact phone numbers, pin codes and remote controls.

Residential applications: Residential GSM intercoms provide secure access via a sim card-operated platform that facilitates the management of contract phone numbers and access control via sms.

Both of these GSM systems eliminate the use of underground cabling between the intercom gate station and the home or business, thus reducing the risk of cabling and equipment being damaged by lightning and wear and tear.

Both analogue and digital wired intercoms are available.

CCTV surveillance cameras & alarms

Analogue, digital, IP, facial and number plate recognition cameras and digital video recorders are available. Alarm systems include wireless indoor and outdoor sensors, pet friendly passives, wireless keypads, GSM notification and IP integrations.

Surveil your property remotely from anywhere.

CCTV surveillance cameras can be integrated with alarm systems and linked to any Smart device, enabling users to view their properties remotely. Alarm systems enable users to log into an App to administer the status of the equipment and notify users of zone-specific alarm activations, arming and disarming, and power failures. The alarms are able to take snapshot images of zones when triggered by an intrusion. These images can be sent directly to the user.

Electric fencing

Paul's Gates supplies and services new installations and conducts up-grades and maintenance of existing electric fencing for residential and commercial applications. Technicians are trained and qualified to issue the government regulatory Certificate of Compliance (COC) for electric fences.

The energisers that are supplied with the fencing are capable of displaying the voltage of the fence to users on site. An auxiliary GSM unit enables users to have access to the status of the fence remotely via the internet.

Training & after-sales service

Employees are empowered to deliver service excellence through daily information-sharing team meetings, coupled with regular training both in-house and at the premises of Paul's Gates' agents to ensure that they are kept abreast of the products' features and industry technology. A fully autonomous Service department is available for after-sales service. 24-hour-service contracts (SLAs) are available.

Other fencing

The range of fencing includes ClearVu and palisade.

Gate manufacture & automation

Paul's Gates designs, manufactures, installs, automates and services sliding and swing gates, and booms and garage doors.

Automations have features such as:

- On-board receivers that store the codes of individual remote controls, ensuring that the details of each member of the group are recorded and administered easily.
- Auxiliary gate alarms that are triggered if the gate stays open longer than it is programmed to.
